Anti-Polishing Ring

Designed to optimize operating costs

Benefit

The use of such a ring prevents the contact between the carbon deposits on the piston crown and the liner.

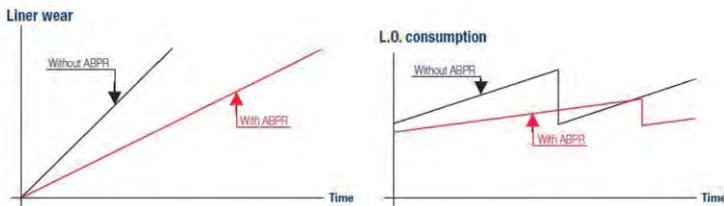

These deposits often cause liner polishing which results in gas blow-by, risk of scuffing and increase lub. Oil consumption.

The solution will

- Decrease liner and piston ring wears
- Save around 1g/kWh of lub oil consumption
- Lessen the blow-by caused by combustion
- Have a short return on investment, less than 2 years

Anti-Polishing Ring

This kit was specially designed to equip the cylinders with an anti-polishing ring.

Anti-polishing ring is manufactured using the centrifugal process. It fits in the inner groove of the cylinder liner and performs the crucial role of removing the carbon deposited on the piston, to enhance the performance of an engine. These rings are made from cast iron grade and machined on the special purpose machines. This anti-polishing ring are used in Diahatsu, Wartsila, Yanmar, etc.
